To The Director, the Secretariat of the Convention on Biological Diversity

The workshop “Towards ‘good practice’ in the use of local and scientific knowledge for informing natural resource management” was held in Aasiaat, Kalaallit Nunaat, 29 November to 1 December 2022 (the Aasiaat Workshop). The workshop was funded by the University of the Arctic, The Danish Agency for Science and Higher Education, and the EU’s Horizon 2020 programme through the CAPARDUS project.

Community-based monitoring of natural resources (CBM) and Citizen Science (CS) are tools that can broaden the basis for management decisions and support adaptive management. They can lead to fast decision-making processes that are able to react to changing climate and pressures. They contribute to sustainability, livelihoods, and food security (see Annex 1-3).

The “Manaus Letter: Recommendations for the Participatory Monitoring of Biodiversity” (ML) provides guidelines for practitioners who organize, or develop capacity in CBM and CS. It was developed by 220 participants from 18 countries by invitation of the CBD Secretariat in 2014. Since the ML was developed, there have been several examples of utilization of the ML recommendations around the world. The Aasiaat Workshop draws on these experiences.

Key outcomes of the Aasiaat Workshop. The participants:

1. Stress the importance of recognizing the value of indigenous knowledge, and the equitable use of it, in natural resource management.
2. Agree on the importance of CBM and CS to obtain knowledge on the natural environment to inform management of natural resources.
3. Acknowledge that knowledge of Indigenous Peoples and Local Communities and conventional science together complement and increase the collective knowledge for decision-making in natural resource management.
4. Evaluate the Manaus Letter recommendations and find that they have contributed successfully to establishing programs on CBM and CS.
5. Highlight the necessity of a continuous focus on improving the structures and systems for information-sharing, communication and dialogue related to knowledge on natural resource management.
6. Identify a need for further testing, and establishing, effective processes for integrating knowledge of Indigenous Peoples and Local Communities and conventional science in decision-making. Do not delay the process.
7. Propose that governments implementing the post-2020 global biodiversity framework must involve Indigenous Peoples and Local Communities to include their knowledge on how nature is changing, and the responses that are being taken to address the biodiversity crisis, while also raising environmental awareness among the general public and policy makers.
8. Stress the need for securing reliable long-term funding and an enabling policy and legal basis for structured CBM and involvement of Indigenous Peoples and Local Communities in natural resource management.
9. Agree on the need to continue to put the Manaus Letter recommendations into practice.

Towards 'good practice' in the use of local and scientific knowledge for informing natural resource management

A workshop organised by the CAPARDUS H2020 project

Aasiaat, Greenland
29 November – 1 December 2022 (3 days)
Language: Greenlandic/English (simultaneous interpretation)

Summary of CAPARDUS

CAPARDUS is a H2020 project with focus on developing guidelines and standards in research, resource exploitation and management, shipping, tourism and community planning in the Arctic. The project contributes to develop, demonstrate, and widely circulate good practices. The project involves scientists, economic actors, local communities, managers and regulators. Workshops and dialogue meetings are used to discuss how the social-environmental systems are changing Arctic communities. The climate change and its consequences in the Arctic leads to new requirements for planning and decision-making based on scientific and economic data, assessments and predictions. A prerequisite for good planning is access to data and information of relevance to people living and working in the Arctic. Community-Based Monitoring (CBM) and Citizen Science (CS) initiatives are evolving across the Arctic, providing complementary data to the scientific observing systems. CBM/CS systems are initiated by people who need specific environmental and climate information to support management of resources, local decision-making and safety of human activities. An example is the PISUNA programme (*Piniakkanik Sumiiffinni Nalunaarsuineq*; <https://www.pisuna.org/>, <https://eloka-arctic.org/pisuna-net/en>). Challenges for CBM and CS projects in the Arctic are mainly to (1) bring CBM/CS systems from *ad hoc* initiatives to sustainable observing systems, (2) connect CBM/CS and scientific observations, (3) make use of CBM/CS data in decision-making, and (4) establish sustained funding.

Workshop objectives

- Review the future for how local knowledge can contribute to inform decision-making on natural resources, and explore how the financial and organizational sustainability of CBM programs can be assured, and how CBM and scientific observations can be connected
- Work towards development of global 'good practice' guidelines in community-based monitoring and management of natural resources
- Test a software tool that can guide decision-making in complex social-ecological systems with limited scientific data but substantial local knowledge
- Discuss how an Arctic Practice System should be connected to CBM/CS systems – and what would be the benefit

Programme

Monday 28 November: Travel to Aasiaat

International participants: Flights from Copenhagen airport at 09.00 by Air Greenland, arrival Aasiaat 12.10 (duration 7 h 10 min)

Check-in at Hotel Sømandshjemmet, Aasiaat, tel. +299 892711, aasiaat@soemandshjem.gl

Tuesday 29 November 0900-16.00: How is the future for the use of local knowledge to inform decision-making on natural resources – Forsamlingshuset Aasiaat

We will together undertake a review of the future for how local knowledge can contribute to inform decision-making on natural resources. Moreover, we will explore how the financial and organizational sustainability of CBM programs can be assured, and how CBM and scientific data can be connected in practice when this is relevant

- 9:00-9:20 Welcome (proposed)
 Mayor Ane Hansen, Qeqertalik Municipality
 Naalakkersuisoq Karl Tobiassen (Minister of Fisheries and Hunting)
- 9:20-9:30 Intro: Finn Danielsen, Martin Enghoff, Michael K. Poulsen
- 9:30-11:00 How do you see the future for local knowledge to inform decision-making on natural resources in Greenland: Should local knowledge be further used for informing decision-making? How?

Representatives of the responsible authorities:
1. Naalakkersuisoq Karl Tobiassen (Minister of Fisheries and Hunting, proposed, 15 min.)
2. APN Hunting, Amalie Jessen
3. APN Fisheries, Robin Holmvang
4. Råstofstyrelsen, Rannvá Clementsen / Rasmus Lindholm
5. Miljøstyrelsen for Råstofområdet, Steen Christensen
6. Qeqertalik Municipality, Hans Inûsugtoq (proposed)
(10 minutes each).
- 11:00-11:15 Coffee break
- 11:15-12.00 Perspectives from organizations and institutions:
1. KNAPK (Association of Fishers and Hunters), Nikkulaat Jeremiassen / Henning Dalager
2. Piniakkaniq Sumiiffinni Nalunaarsuineq (PISUNA) in Attu, Nuunoq (Per Ole) Frederiksen
3. Greenland Institute of Natural Resources, Dept. Fish & Shellfish, Rasmus Nygaard
4. Oceans North Kalaallit Nunaat, Parnuna Egede
(10 minutes each).
- 12:00-13:00 Lunch
- 13:00-14:00 How can the financial and organizational sustainability of CBM programs be assured? Lessons from case examples, followed by discussion in plenum
Presentations by resource persons:
1. Bering Sea, Indigenous Sentinels Network, Hannah-Marie Garcia (15 minutes)
2. Greenland, Sustainable Fisheries Greenland, Rasmus Hedeholm (5 minutes)
3. Alaska, Arctic Observatory & Knowledge Hub, Donna Hauser & Roberta Glenn (video, 5 minutes)

4. Brazil, Kirsten Silvius & Pedro Constantino (video, 5 minutes)

Plenum: Discussion of priorities / necessary tasks ahead

14:00-14:15 Coffee break

14:15-16:00 How can CBM and scientific data be connected in practice for management decision-making when this is relevant? Lessons from case example, followed by discussion in plenum

Presentation by resource persons:

4. Greenland Institute of Natural Resources, Dept. Mammals & Birds, Rikke G. Hansen (10 minutes)
5. Universidade de Brasília, Braulio de Souza Diaz (10 minutes)
6. Jessica Lefevre (20 minutes)

Plenum: Discussion of priorities / necessary tasks ahead

19:00 Dinner at restaurant (hosted): Restaurant Nanoq, Fr. Lyngesvej 12

Wednesday 30 November 0900-16.00: Towards the development of global ‘good practice’ guidelines in community-based monitoring and management of natural resources

In 2015, the “Manaus Letter: recommendations for the Participatory Monitoring of Biodiversity” was published (Link: <http://dx.doi.org/10.25607/OPB-965>). This is a guideline comprising 40 recommendations for practitioners who organize, or develop capacity in, community monitoring of natural resource systems and the environment. The guideline was developed by 220 participants from 18 countries, inc. Greenland and Alaska. It was prepared by invitation of the Convention on Biological Diversity Secretariat at the “International Seminar on Participatory Monitoring of Biodiversity for the Management of Natural Resources” in Manaus, Brazil, Sep. 22–26, 2014. Based on case studies from different regions, we will discuss if it is meaningful to update this guideline and promote its broader use across the Arctic and globally.

9:00-9:10 Intro: Finn Danielsen, Martin Enghoff, Michael K. Poulsen

9:10-9:25 The Manaus Letter process (Herizo Andrianandrasana, University of Warwick, UK) (15 minutes)

9:25-9:40 CBM in international processes of the Convention on Biological Diversity - and future perspectives (Braulio de Souza Diaz, former Head of Secretariat, CBD & Professor, Universidade de Brasília, Brazil) (15 minutes)

9:40-9:55 Coffee break

9:55-12:00 Are the 40 recommendations in the Manaus Letter still relevant, or are some of them no longer helpful? Are there new recommendations that are also important?

Case examples (followed by questions/answers)

7. Greenland, Caroline Bouchard (3 slides, 5 minutes)
8. Arctic Russia, Kobe University, Japan, Yuka Oishi (15 minutes)
9. Bering Sea, Indigenous Sentinels Network, Hannah-Marie Garcia (5 minutes)
10. Brazil, Kirsten Silvius & Pedro Constantino (video, 5 minutes)
11. Alaska Arctic Observatory & Knowledge Hub, Donna Hauser & Roberta Glenn (video, 5 minutes)
12. Alaska, Jessica Lefevre (5 minutes)

12:00-13:00 Lunch

13:00-14:30 Group work. Questions: How can an updated Manaus Letter be completed and more widely disseminated? For example, what can be recommended with regards to sustaining and financially securing CBM programs? Would it be helpful if an international institution would 'host' the guidelines as a 'standard' on CBM?

14:30-15:00 Coffee break

15:00-16:00 Plenum. Presentation of group findings. Discussion of priorities / necessary tasks ahead

Thursday 1 December 9:00-12:00: Excursion.

Boat trip to Disko Bugt. Alternatively, guided walking tour in Aasiaat town, dependent on the weather

12:00-12:30 Lunch

12:30-15:00: Session about a software tool that can guide decision-making in complex social-environmental systems (led by Roel May, Birger Poppel, Vivianne Mazzocco) – Forsamlingshuset Aasiaat
Statistical models have considerable potential to guide decision-making in areas characterized by limited scientific data and substantial local knowledge.

12:30-12:45 Introduction to the use of Bayesian (BBN) models in natural resource management and CBM-programmes: Roel May

12:45-13:00 Demo of the surBayes tool: Roel May

13:00-13:30 Plenum discussion: In which natural resource management contexts and CBM situations in the Arctic could BBN models be used for scenario assessments?

13:30-14:30 Group work: Build your own BBN model using the surBayes app.

14:30-15:00 Plenum discussion: Strengths and weaknesses of BBN models. What is their usefulness and how can they guide decision-making? Coffee/tea available

15:00-16:30: Session on Arctic Practice System (led by Siri Jodha Khalsa, Stein Sandven)

An Arctic Practices System (APS) is envisioned to be a sustained repository for practices related to environmental observations, resource exploitation and other activities in the Arctic. A 'practice' means a documentation in digital form of how things are done for example in observation of a specific ocean phenomenon. What an APS should do will be identified in dialogue with people living or working in the Arctic with knowledge about practices in their daily work. An example of Arctic practices is found at <https://repository.oceanbestpractices.org/handle/11329/1291>, where you can give keywords and the repository will identify documents containing those keywords.

15:00-15:10 Introduction to the concept of an Arctic Practice System (APS)

15:10-15:30 Demo of Arctic Community in the established Ocean Best Practice System (OPBS), where more than 100 Arctic Practices documents are stored

15:30-16:30 Desirable characteristics for the APS? First cut at priorities.
Discussion led by Siri Jodha and Stein Sandven. Coffee/tea available

16:30-17:00 Wrap-up of the three-day workshop and next steps, by Finn Danielsen, Martin Enghoff, Michael K. Poulsen

Friday 2 December: Departure

International participants: Flights from Aasiaat airport at 10.30 by Air Greenland, arrival Copenhagen 20.00 (duration 5 h 30 min).

Funded by the European Union's Horizon 2020 research and innovation programme through the CAPARDUS project under grant agreement No 869673, and by the Danish Agency for Science and Higher Education through the UArctic Thematic Network on Collaborative Resource Management

Manaus Letter: Recommendations for the Participatory Monitoring of Biodiversity

Manaus Letter: Recommendations for the Participatory Monitoring of Biodiversity

Representatives of Indigenous Peoples, civil society, researchers and government decision-makers from 18 countries gathered in Manaus, Brazil, on 22-26 September 2014 to discuss and share experiences with community-based monitoring of natural resources. Among the participants were people from Greenland and Alaska. All shared a common desire to strengthen community-based monitoring of natural resources. They would like to accelerate the uptake of community-based monitoring of natural resources among practitioners, scientists and civil society.

The Manaus Letter contains a number of recommendations for 'good practice' in community-based monitoring of natural resources. The recommendations are a result of the meeting in Manaus. The recommendations are general, and their relevance depends on the purpose of the individual initiatives and the special circumstances that exist in the individual areas.

Recommendations

Design of monitoring initiatives

- 1 Initiatives should be constructed from the bottom up, incorporating local as well as academic visions and knowledge.
- 2 Roles, responsibilities and institutional arrangements should be carefully identified via a thorough dialogue with the communities prior to beginning the initiative, considering the communities' capacities, needs and interests.
- 3 Monitoring targets should prioritize resources that are of local subsistence or economic value or in other ways meaningful to local people.
- 4 The methods and instruments used for monitoring should be easy to use, suitable, and appropriate to local practices and culture.
- 5 The designers of a participatory monitoring initiative must evaluate the potential positive and negative impacts associated with its implementation before starting it, keeping in mind that the benefits may not compensate for the associated workload and governance issues and therefore implementation may not be desirable.
- 6 Whenever possible, new initiatives should build on existing local initiatives rather than replacing them.
- 7 Data gathered should contribute to decision making on resource use, territorial management, socio-environmental policies at different scales, or other objectives that are jointly agreed on.
- 8 The monitoring initiative's methods, governance structure, data produced, and use of information for management should be regularly reviewed in order to make any necessary adjustments.

Community participation in monitoring initiatives

- 9 Community members involved in monitoring should be selected by the communities themselves supported by their partner organizations considering their responsibility, capacity, commitment and experience.
- 10 The role of community actors in decision making for territorial management and resource use can be enhanced through the promotion of broad community participation in all aspects of monitoring initiatives and implementation of regular community meetings to disseminate, review and value the information produced.

Institutional arrangements and partnerships

- 11 The participation of diverse social actors is necessary for the success of participatory monitoring initiatives; partnerships and multi-institutional arrangements should be formalized before implementation of the initiatives.

12 Monitoring initiatives must reconcile and balance the interests and motivations of local, regional and global actors involved in the initiative; mutual trust among these actors is essential for success. Relationships must be transparent, initiative construction and design must include realistic expectations from all partners, and initiative objectives must be clear and consider the interests of all actors.

Data quality and management

13 Data quality is fundamental if participatory monitoring of biodiversity is to achieve its objectives; it is therefore essential that data collection be standardized at the necessary scales (among monitors, among communities, and among initiatives if the scale of monitoring is regional or global).

14 Data quality can be ensured by several mechanisms, including continuous training of persons involved in data collection, data quality assessment by researchers and community members, effective community involvement in all aspects of monitoring, and collective understanding and social control by the community. Additionally, community leaders participating in the project should be responsible for verifying data integrity.

15 When feasible, recognized statistical analysis or data filtering systems should be used to prevent the accumulation of errors in monitoring databases and ensure objectivity and standardization in data quality.

16 Data from biodiversity monitoring should be stored in a systematic manner using best practices of data base management.

17 Participatory monitoring data should always be available to local communities

18 Use and application of monitoring data should respect the characteristics, limitations and restrictions inherent in the data.

19 Data interpretation and analysis that are relevant for local management should be carried out as quickly as possible, with the participation of local actors, in order to accelerate and facilitate data use in local decision-making.

20 When monitoring initiatives are designed for use at the regional or global scale, they should ensure the return of information and results to participating local communities. Communication mechanisms must be in place in these larger scale initiatives to guarantee community access to information and transference of knowledge, ensuring that information can and will be in fact returned.

Relationship between monitoring initiatives and public policy

21 Public policies on natural resources management, education, and territorial management should be improved by incorporating information derived from participatory monitoring.

22 There should be a feedback relationship between participatory monitoring initiatives and public policies: the initiatives should stimulate and promote the use of monitoring results in technical and political decision making, and decision makers should recognize and support processes of participatory natural resource monitoring.

23 Non-community decision-makers should respect and use the information generated by communities and the way in which communities use this information for local management.

24 Participatory monitoring approaches and information should be disseminated to other enterprises and sectors of society that are not organized into community-based governance systems, such as small and large landowners, the private sector, and agencies involved with environmental impact assessments, thus bringing the benefits of scale, transparency and social control to these other sectors that impact and/or depend on biodiversity and natural resource use.

25 Participatory monitoring should be promoted by and applied in programs and policies linked to environmental services.

Recognition of community involvement

26 The entities involved in participatory monitoring should recognize the contribution and intellectual property of the community in the publication of materials, for instance through co-authorship in technical-scientific works that are based on or include community efforts, when this is of interest to the community and appropriate for the publication, seeking when possible to shift current publication customs and practices of journals and publishing houses.

27 The issue of remuneration for participatory monitoring must be broadly discussed by all stakeholders; community agents involved in monitoring initiatives must be formally compensated – financially or not – in a fair and appropriate manner agreed to with the participating community.

28 National and international research institutions should recognize the current and potential value of information generated by well designed and implemented participatory monitoring and should more often establish and promote partnerships for participatory monitoring.

29 The funding agencies for conservation, research, technological innovation and education should promote and support participatory monitoring as a mechanism to enhance biodiversity conservation and community empowerment.

Institutional and community strengthening

30 Recognizing that participatory monitoring is one mechanism for community strengthening, participatory monitoring initiatives should promote the reduction of local social inequalities, in particular stimulating the involvement of women and youth and other marginalized groups when appropriate to the local culture and when prioritized by the communities.

31 In order to guarantee grassroots participation, participatory monitoring initiatives should stimulate and support the development and strengthening of community and social organization, ensuring social cohesion and effective participation in the initiatives.

32 Local community monitoring groups should be strengthened to enhance their role in discussions of information and decision making based on participatory monitoring results.

Capacity building

33 Capacity building for community involvement in participatory monitoring must be included in formal education programs. Such capacity building should address the needs of the diverse social actors that participate individually and collectively (including community organizations) in monitoring and management, emphasizing the relationship of monitoring to environmental and territorial management and to the development and social control of public policies.

34 Education processes should address improvements in critical thinking for all actors involved in participatory monitoring; such education is as important as technical training to ensure the quality of the information generated by participatory monitoring.

35 The social-environmental issues addressed by participatory monitoring initiatives should be included as crosscutting themes in local public schools.

36 When designing for support of monitoring activities, actions that respond to community concerns should be prioritized, foreseeing the need for continuous support to increase the sustainability of the initiatives in the medium and long term and enable adaptive management.

37 The financial support of participatory monitoring initiatives should consider financial arrangements and mechanisms of implementation appropriate to local realities of participatory monitoring activities.

Systematization, dissemination and communication

38 Methodologies and materials for participatory monitoring, including species identification guides, information management systems and best practices in monitoring and management should be made broadly available.

39 All stages and results of monitoring initiatives should be disseminated among communities, in the press, in scientific meetings, and through social networks.

40 Local, traditional and indigenous knowledge used in and produced by biodiversity monitoring should be systematized and made publicly available, ensuring that there is consent among the knowledge holders.
